Question 1: Sorting Algorithm Complexity

Q: Which of the following sorting algorithms has an average-case time complexity of $O(n \log n)$?

- a. Bubble Sort
- b. Quick Sort
- c. Selection Sort
- d. Insertion Sort

Answer: b. Quick Sort

Explanation:

- Bubble Sort and Selection Sort both have average and worst-case complexities of $O(n^2)$.
- Insertion Sort also exhibits $O(n^2)$ behavior in the average and worst cases.
- Quick Sort's average-case time complexity is $O(n \log n)$, making it efficient for large datasets, although its worst-case is $O(n^2)$.
- Therefore, the correct answer is Quick Sort.

Question 2: Graph Traversal

Q: Which traversal method can be used to determine if a graph contains a cycle?

- a. Breadth-First Search (BFS)
- b. Depth-First Search (DFS)
- c. Both BFS and DFS

d. Neither BFS nor DFS

Answer: c. Both BFS and DFS

Explanation:

- Both BFS and DFS can be used to detect cycles in a graph.
- In undirected graphs, a cycle exists if during BFS or DFS traversal, an already visited node is encountered that is not the parent of the current node.
- In directed graphs, cycle detection involves checking for back edges during DFS.
- Since both traversal methods can be adapted for cycle detection, the correct answer is both.

Question 3: Algorithm Stability

- b. Heap Sort
- c. Merge Sort
- d. Selection Sort

Answer: c. Merge Sort

Explanation:

- Stability in sorting algorithms refers to preserving the relative order of equal elements.
- Merge Sort is inherently stable if implemented correctly because it merges sorted subarrays without changing the order of equal elements.
- Quick Sort, Heap Sort, and Selection Sort are generally not stable, though stability can be achieved with modifications.
- The most straightforward stable algorithm among these options is Merge Sort.

Question 4: Dynamic Programming Application

Q: Which approach is best suited for solving the 0/1 Knapsack problem?

- a. Greedy Algorithm
- b. Divide and Conquer
- c. Dynamic Programming
- d. Backtracking

Answer: c. Dynamic Programming

Explanation:

- The 0/1 Knapsack problem involves making optimal choices with overlapping subproblems and optimal substructure?key indicators for dynamic programming solutions.
- Greedy algorithms do not guarantee optimal solutions for this problem.
- Divide and conquer is less suitable due to overlapping subproblems.
- Backtracking can solve the problem but is less efficient than dynamic programming.
- Therefore, dynamic programming is the best approach.
