Using Ohm's Law: $(I = \frac{V}{R})$

$$(I = \frac{12V}{220\Omega} \approx 0.0545A) \text{ or } 54.5mA$$

Problem 2:

A circuit has a current of 0.2A flowing through a resistor of 100 Ω . Find the voltage across the resistor.

Solution:

Voltage $(V = IR)$

$$(V = 0.2A \times 100\Omega = 20V)$$

- Series and Parallel Circuit Practice Problems

Problem 3:

Two resistors, 100 Ω and 200 Ω , are connected in series. Find the total resistance and the current if the applied voltage is 24V.

Solution:

$$\text{Total resistance } (R_{\text{total}} = R_1 + R_2 = 100\Omega + 200\Omega = 300\Omega)$$

$$\text{Current } (I = \frac{V}{R_{\text{total}}} = \frac{24V}{300\Omega} = 0.08A)$$

Problem 4:

Calculate the equivalent resistance of two resistors, 150Ω and 300Ω , connected in parallel.

Solution:

$$\left(\frac{1}{R_{\text{eq}}} = \frac{1}{R_1} + \frac{1}{R_2} \right)$$

$$\left(\frac{1}{R_{\text{eq}}} = \frac{1}{150\Omega} + \frac{1}{300\Omega} = \frac{2}{300} + \frac{1}{300} = \frac{3}{300} \right)$$

$$\left(R_{\text{eq}} = \frac{300\Omega}{3} = 100\Omega \right)$$

- Capacitor and Inductor Practice Problems

Problem 5:

Advanced Practice Problems for Deeper Understanding

- Diode and Rectifier Circuit Problems

Problem 7:

A silicon diode has a forward voltage drop of 0.7V. If 10mA current flows through it, what is the approximate voltage across the diode?

Solution:

Ripple factor ≈ 1.21 for a half-wave rectifier.

Peak voltage $(V_{peak} \approx 12V)$ (minus diode drop).

Calculations involve more detailed analysis, including filtering, but understanding the ripple factor helps assess the quality of rectification.

- Transistor and Amplifier Circuit Problems

Problem 9:

Calculate the collector current (I_C) in a bipolar junction transistor (BJT) with a base current $(I_B = 20\mu A)$ and current gain $(\beta = 100)$.

Solution:

$$(I_C = \beta \times I_B = 100 \times 20\mu A = 2mA)$$

Problem 10:

In a common-emitter amplifier, if the collector resistor is 10k Ω and the collector voltage is 5V with a supply voltage of 12V, find the collector current (I_C) .

Solution:

Using Kirchhoff's Voltage Law:

$$V_{CC} = I_C R_C + V_{CE}$$

Assuming V_{CE} is approximately 5V, then:

$$I_C = \frac{V_{CC} - V_{CE}}{R_C} = \frac{12V - 5V}{10k\Omega} = 0.7mA$$

QuestionAnswer What is Ohm's Law and how is it used in basic electronics practice? Ohm's Law

states that the current flowing through a resistor is directly proportional to the voltage across it and inversely proportional to its resistance, expressed as $I = V / R$. It is used to calculate voltage, current, or resistance in electrical circuits during troubleshooting and design. How do you calculate the total resistance in a series circuit? In a series circuit, the total resistance is the sum of all individual resistances: $R_{\text{total}} = R_1 + R_2 + R_3 + \dots$. What is the purpose of a capacitor in a circuit, and how do you calculate its capacitance? A capacitor stores electrical energy and filters signals or smooths power supply fluctuations. Its capacitance is measured in Farads (F) and depends on the physical characteristics of the capacitor, calculated as $C = Q / V$, where Q is the stored charge and V is the voltage across it. How do you determine the equivalent resistance of resistors in parallel? For resistors in parallel, the reciprocal of the total resistance is the sum of reciprocals of individual resistances: $1 / R_{\text{total}} = 1 / R_1 + 1 / R_2 + 1 / R_3 + \dots$. What is the function of a diode in a circuit? A diode allows current to flow in one direction only, acting as a one-way valve, which is useful for rectification and protecting circuits from reverse polarity. How do you interpret the color code on a resistor? Resistor color codes use colored bands to indicate resistance value and tolerance. Each color corresponds to a number, and the position of the bands determines how to read the value, typically with the first two bands representing significant digits and the third as a multiplier. What is the difference between AC and DC voltage? AC (Alternating Current) changes direction periodically, while DC (Direct Current) flows in one constant direction. AC is used in household power supplies, whereas DC is used in batteries and electronic devices. How do you calculate the power consumed by a resistor? Power dissipated by a resistor can be calculated using $P = V \times I$, or $P = I^2 \times R$, or $P = V^2 / R$, depending on the known quantities. What is a breadboard and how is it used in electronics practice? A breadboard is a tool for prototyping electronic circuits without soldering. Components and jumper wires are inserted into interconnected sockets to build and test circuits quickly and easily.
