Mold mycotoxins are secondary metabolites produced by specific molds, notably species of *Aspergillus*, *Penicillium*, *Fusarium*, and *Stachybotrys*. These compounds are biologically active and

often toxic to humans and animals. Unlike mold spores, mycotoxins are chemical substances that can cause biological harm even in the absence of visible mold growth.

Common Types of Mold Mycotoxins

- Aflatoxins: Produced primarily by *Aspergillus flavus* and *A. parasiticus*, they are potent carcinogens linked to liver cancer.
- Ochratoxin A: Generated by *Aspergillus* and *Penicillium* species; associated with nephrotoxicity and potential carcinogenicity.
- Gliotoxin: Produced by *Aspergillus fumigatus*, implicated in immune suppression.
- Trichothecenes: Such as deoxynivalenol (DON), produced by *Fusarium* species, causing nausea, vomiting, and immunosuppression.
- Satratoxins and Trichoverrols: Toxic compounds linked with *Stachybotrys* species, associated with respiratory issues.

Current Evaluation of Mold Mycotoxins

Accurate assessment of mycotoxin exposure is critical for diagnosis, management, and prevention. The evaluation process involves environmental assessments, biological testing, and clinical evaluations.
