Understanding Differential Equations

What Is a Differential Equation?

A differential equation is a mathematical equation that involves an unknown function and its derivatives. These equations express relationships between a function and its rates of change, enabling us to model dynamic systems where quantities evolve over time or space.

For example, the simple differential equation:

Classification of Differential Equations

Differential equations are categorized based on various criteria, aiding in selecting appropriate solution methods.

1. Order of Differential Equations

The order refers to the highest derivative present in the equation.

- First-order Differential Equations: Involve only the first derivative, $\left(\frac{dy}{dx}\right)$.
- Higher-order Differential Equations: Involve derivatives of second order or higher, such as $\left(\frac{d^2y}{dx^2}\right)$.

2. Degree of Differential Equations

The degree is the power of the highest-order derivative after the equation is expressed in polynomial form.

3. Linear vs. Nonlinear Differential Equations

- Linear Differential Equations: Can be expressed as a linear combination of derivatives and functions.

$$\left[\frac{d^n y}{dx^n} + a_{n-1}(x) \frac{d^{n-1} y}{dx^{n-1}} + \dots + a_0(x) y = g(x) \right]$$

- Nonlinear Differential Equations: Contain nonlinear terms involving the function or its derivatives.

4. Homogeneous vs. Non-Homogeneous Equations

- Rearrange to isolate variables:

$$\left[\frac{1}{h(y)} dy = g(t) dt \right]$$

- Integrate both sides:

$$\int \frac{1}{h(y)} dy = \int g(t) dt + C$$

Example:

$$\text{Solve } \frac{dy}{dt} = y$$

- Multiply the entire differential equation by $\mu(t)$:

$$\mu(t) \frac{dy}{dt} + \mu(t)p(t)y = \mu(t)q(t)$$

- Recognize the left side as the derivative of $\mu(t)y$:

$$\frac{d}{dt} [\mu(t)y] = \mu(t)q(t)$$

- Integrate both sides:

$$\int \mu(t) y = \int \mu(t) q(t) dt + C$$

- Solve for y :

$$y(t) = \frac{1}{\mu(t)} \left(\int \mu(t) q(t) dt + C \right)$$

- Homogeneous Equations

Applicable to: Equations where functions are homogeneous of a certain degree.

Approach:

- Substitute $y = vx$ or similar to reduce to a simpler form.
- Use substitution to convert the equation into a separable form.

- Exact Equations

Applicable to: Equations of the form $M(t, y) + N(t, y) \frac{dy}{dt} = 0$, where M and N satisfy the exactness condition:

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial t}$$

Approach:

- Find a potential function $\Psi(t, y)$ such that:

$$\frac{\partial \Psi}{\partial t} = M(t, y)$$

$$\frac{\partial \Psi}{\partial y} = N(t, y)$$

- The solution is then given implicitly as:

$$\Psi(t, y) = C$$

Special Techniques and Considerations
